- SMALLEST WORD IN STRING:

i/p: "Hi hello how great"
o/p: Hi

Approach:

→ Take i/p string and traverse.
→ if current char is not space, build the word ~~with~~ and store in a string.
→ Track
  ↳ current word length.
  ↳ compare with ~~ma~~ minWord length and store curr word with smallest length for each traversal.

→ Print smallest word

Pseudocode:

```
string s
minWord=""
len = ~~length~~ s.length()
currWord = " "
for (0 to s.length()) → i
{ if (ch != ' ')
      currWord += ch

  else {
      if (currWord.length > 0 && length < len) {
          len = currWord.length();
          minWord = currWord
      }
```

```
    currWord = " ";
  }
}
}
print (minWord);
```

Code:

```
String minWord = "";
int len = s.length();
String currWord = "";
for(int i=0; i<s.length(); i++){
  char ch= s.charAt(i);
  if(ch!=' ') currWord += c;
  else {
    if(currWord.length() < len){
        len = currWord.length();
        minWord = currWord;
    }
    currWord = "";
  }
}
if (currWord.length() < len){
    minWord = currWord;
}
System.out.println("Smallest word: "+ minWord);
```
